FINAL COMMUNITY RELATIONS PLAN SKINNER LANDFILL, WEST CHESTER, OHIO

This final community relations plan describes the community relations program to be implemented during the remedial investigation and feasibility study at the Skinner Landfill Superfund site, located in West Chester, Ohio. The United States Environmental Protection Agency (EPA) Region V office will have lead responsibility for technical and community relations work at the Skinner Landfill. To be effective, however, the community relations program will require close coordination among state, local, and federal officials.

This community relations plan is divided into the following four sections:

- A. Background and Key Issues
- B. Objectives of the Community Relations Program
- C. Community Relations Techniques
- D. Schedule and Staffing Plan

The analysis in sections A through C is based on interviews with representatives of the Ohio Environmental Protection Agency (Ohio EPA), Butler County Health Department, and Union Township. These interviews were conducted in the West Chester, Ohio area during late April 1985.

The schedule and staffing plan presented in Section D provides a proposed schedule of community relations activities at the Skinner Landfill site. These activities coincide with the technical milestones for the site. In addition, a contact list of key officials, media representatives, interest groups, and local citizens has been included as Appendix A. This appendix also identifies possible locations for an information repository and for public meetings to be scheduled in the West Chester area during the remedial investigation and feasibility study.

A. BACKGROUND AND KEY ISSUES

Site History

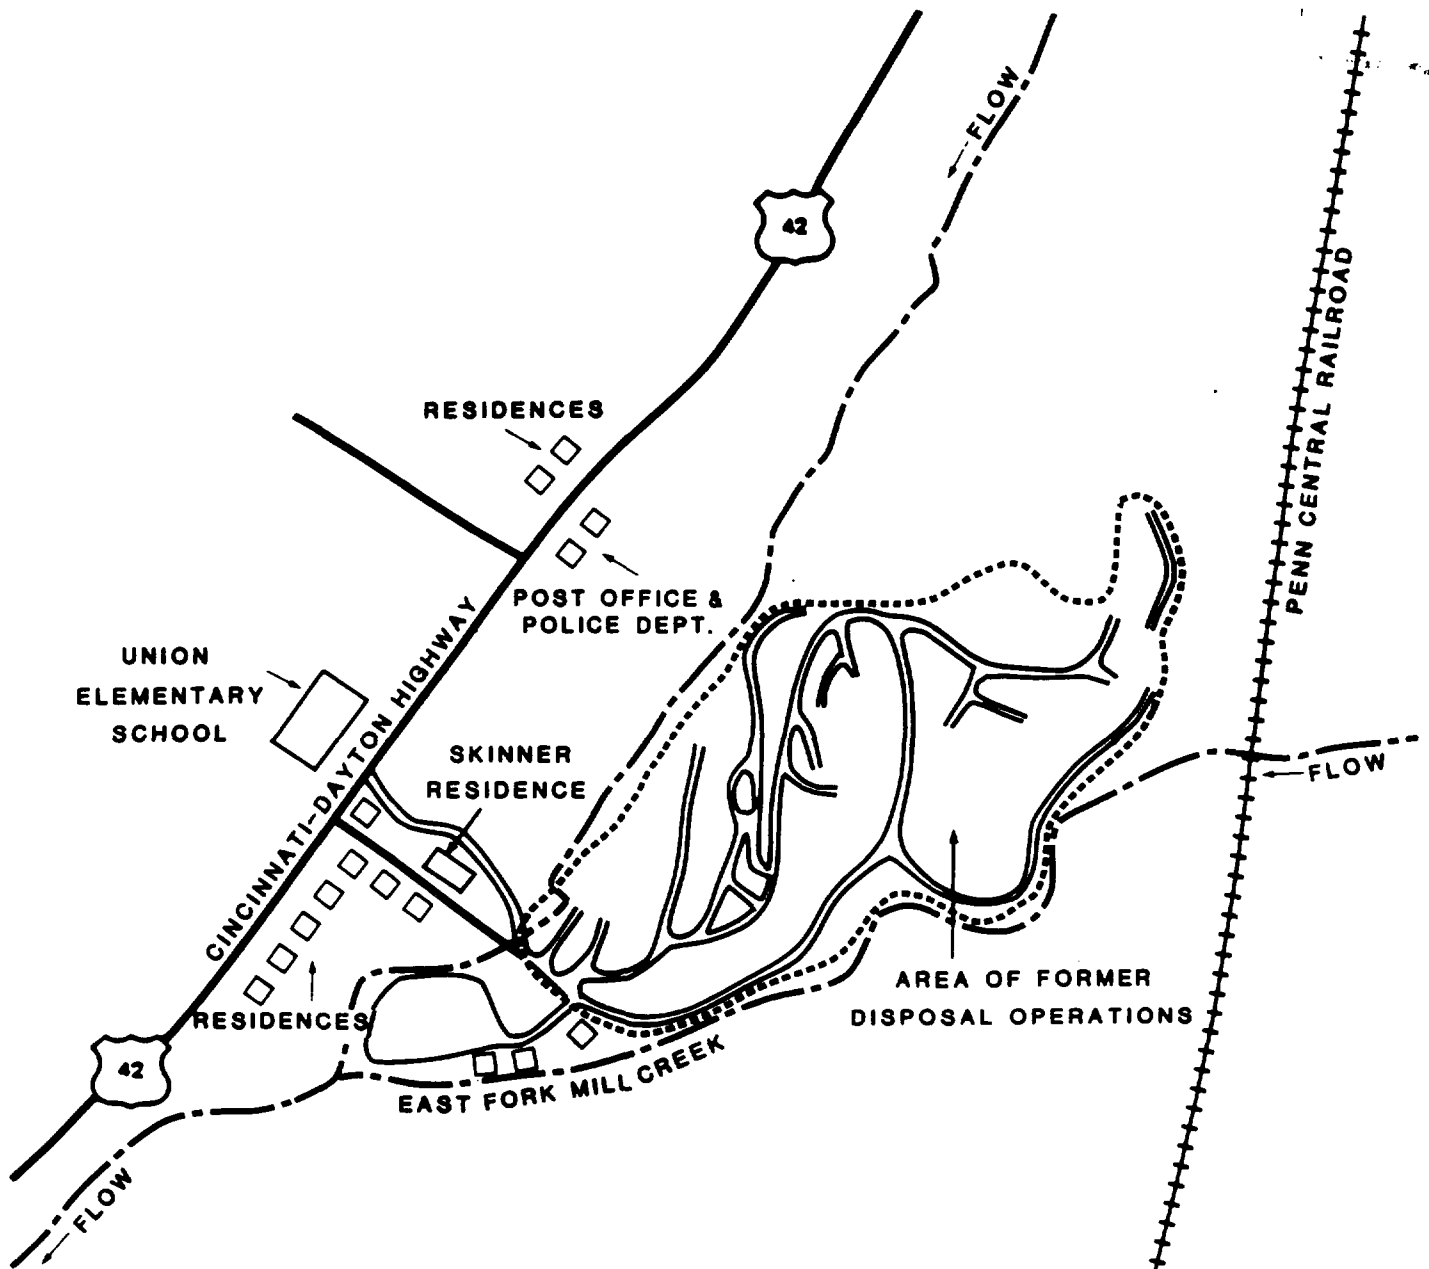

The Skinner Landfill site consists of a 78-acre area in the town of West Chester, in Union Township, Butler County, Ohio. West Chester is located approximately 25 miles north of the city of Cincinnati and approximately five miles from Hamilton, the county seat for Butler County (see the Exhibit 1 for a location map). West Chester is primarily a residential "bedroom," community for the cities of Cincinnati, Hamilton, and Dayton, Ohio.

The Skinner site consists of wooded, hilly terrain bordered on the east by railroad tracks and on the west by the Cincinnati-Dayton Road (see Exhibit 2 for a site map). The east fork of Mill Creek runs along the southeast edge of the site and flows south for about 20 miles before emptying into the Ohio

River. Since 1956 the Skinner property and surrounding areas have been zoned for residential use. Single family homes are located approximately 2,000 feet from the disposal area of the site. Several homes are located adjacent to the access road to the site and the Union Elementary School is located immediately across from the entrance to the site on the Cincinnati-Dayton Road. The disposal area is not directly visible from the Cincinnati-Dayton Road, however, some of the surface debris can be seen through the trees. The site is not fenced or marked in any way.

The property has been owned by Albert and Elsa Skinner since the 1930s. Since that time, portions of the property have been used for disposal of general municipal wastes. In 1963, the Butler County Health Department approved a permit application from Albert Skinner to operate a sanitary landfill on his property; however, a subsequent application from Skinner to install and operate an incinerator at the site was not approved.

Residents reported that hazardous wastes were disposed at the site as early as 1963. In addition, according to state records, the Chem-Dyne Corporation had an agreement with the Skinners whereby Albert Skinner's oldest son, John, agreed to repair and clean Chem Dyne equipment used for hauling chemical wastes.

From 1963 to 1976, the Butler County Health Department, and Southwestern Ohio Air Pollution Control (SWOAPC) received periodic complaints from nearby residents of heavy smoke coming from the site. During one fire in 1963, firemen were denied access to the property by Mr. Skinner. On Easter Sunday, April 18, 1976, a fire at the site sparked immediate attention from local and state officials. The activities occurring from April 18 to May 11, 1976 were as follows:

April 18, 1976 - A nearby resident reported a fire at the site to the Union Township Fire Department and SWOAPC. Firemen and SWOAPC officials responding to the report noted that old tires, debris, and grass were being burned. While on the site, officials also observed a lagoon near the fire that reportedly contained a black oily liquid.

April 21, 1976 - The Health Commissioner of the Hamilton City Health Department contacted Mr. Moore of Ohio EPA, South West District Office (SWDO). The Health Commissioner suspected that Mr. Skinner was accepting industrial waste from the Chem-Dyne Corporation Industrial Waste Storage Plant in Hamilton. In addition, the Health Commissioner notified Mr. Moore of the recent fire at the site and the location of the lagoon observed during the fire.

- April 22, 1976 - With the owners permission, Mr. Moore and SWOAPC officials inspected the site. During the inspection, John Skinner denied permission to the officials to investigate the area where the recent fire occurred.
- April 26, 1976 - The officials and several detectives from the Butler County Sheriff's Department returned to the site with a search warrant to inspect the site. The officials reported that the area where the lagoon was reported to be located was recently regraded and that there were "hundreds" of 55 gallon drums on the site that contained industrial and chemical wastes. Samples were taken of surface puddles on the site and photographs were taken of the site.
- May 3, 1976 - Ohio EPA received calls from residents who claimed that the Skinners had been trucking unknown materials off the property.
- May 4, 1976 - Ohio EPA officials returned to the site for additional sampling, but were prevented from entering the site by a bulldozer blocking the sole access road. Albert Skinner told the officials that he buried explosive devices on the site in addition to nerve gas, mustard gas, and cyanide. Ohio EPA left the site without conducting the sampling.
- May 11, 1976 - Ohio EPA and representatives of the U.S. Army Special Military Unit and Butler County Sheriff's Department entered and proceeded to inspect the site. During this inspection they excavated a lagoon and took samples. The analysis found chlorinated pesticide intermediates.

From May 1976 through the summer of 1977, Ohio EPA conducted additional investigations of the site. In addition, Albert Skinner hired a consultant in the summer of 1976 to investigate the geology of the site. In August 1977, the Attorney General filed a lawsuit in the Ohio Court of Common Pleas against the Skinners requesting them to remove the wastes disposed of on the site. During these legal proceedings, which lasted approximately 18 months, no further site investigations were conducted by Ohio EPA. In January 1979, the state court ruled that the state failed to show by clear and convincing evidence that the chemical waste buried on site required removal by the Skinners. However, the court ordered the Skinners to stop all disposal activities unless they received specific authority from Ohio EPA and the Butler County Board of Health. John Skinner was permitted to continue his arrangement with Chem Dyne to clean and repair tank trucks on the Skinner property.

The site was listed on EPA Superfund National Priorities List (NPL) in December 1982. In July 1983, EPA contractors completed a Remedial Action Master Plan (RAMP) for the Skinner site; a remedial investigation and feasibility study (RI/FS) was planned for late 1983. However, because of limited EPA resources, an RI/FS did not begin at the site. Currently, EPA contractors have been assigned to the site and are preparing a work plan for the RI/FS. The RI/FS is expected to begin in the summer of 1985, however, possible opposition from the Skinners to entry on the property could delay initiation of RI/FS activities. The Skinners did not grant access voluntarily to U.S. EPA or its contractors in February 1985 to perform a pre-RI/FS survey. The U.S. government went to court (U.S. District Court, South District of Ohio) to obtain a warrant for access. The Skinners challenged the warrant, and a final court decision is still pending.

Data on the exact type and quantity of the wastes disposed at the site are limited. Investigations by Ohio EPA and U.S. EPA indicate that the wastes include pesticide intermediate compounds, heavy metals and chlorinated solvents. Surface debris currently on the site consists of tanks, drums, old cars, tree stumps, tires, aerosol cans, old washers, dryers, etc. The remedial investigation and feasibility study planned for the site will investigate the type and extent of soil, ground water, and surface water contamination.

History of Community Concern

Community concerns about the Skinner Landfill have fluctuated over the many years of disposal operation. In 1963, according to EPA files, the community opposed the granting of a permit by the Butler County Board of Health to Albert Skinner for the operation of a sanitary landfill on the property. State records indicate that during 1963 a residents' association, the Union Township Improvement Association, claimed that the site was a dangerous nuisance and pressed the Health Department to investigate the operations of the site. In August 1963, the Cincinnati Enquirer reported that Mr. Skinner was arrested for violating county zoning regulations.

In early 1964, the Enquirer ran another article about Mr. Skinner's unsuccessful efforts to get county approval for a permit to install an incinerator on his property. The article reported that more than a hundred residents attended a county-held hearing to express their opposition to the permit. The permit application was withdrawn by Skinner because of errors in the application.

From 1963 to 1976, residents complained frequently, sometimes several times a day, to the Butler County Board of Health and Township Fire Department about noxious odors and smoke emanating from the site and excessive truck traffic going into the site property. The 1976 fire and subsequent investigative activities at the site attracted considerable attention from the residents.

Since 1976, there have been fewer complaints about the site. Local officials and residents interviewed as part of this CRP attribute the reduced number of complaints to the following factors:

- Open burning has not occurred at the site since 1976 and there has been less truck traffic around the site.
- The unsuccessful enforcement actions by the state in 1979 have lead residents to believe that nothing would be done to clean up the site.
- Many of the residents formerly involved with the site no longer live in the area and newer residents are less informed about the site.

Potential Concerns of the Community

As mentioned above, there is not currently a significant or widespread level of community concern about the site. However, because of the long history of vocal concern expressed about the site, EPA should continuously monitor several issues that could lead to renewed community concern and activism. These issues are discussed below.

Contents of Landfill. Presently, there is limited information about what has been disposed of at the site. One resident expressed dismay that because both Albert and John Skinner have died, no one knows what was buried at the site.

The residents interviewed in April 1985 frequently referred to "stories" that substances such as mustard gas and other military wastes were disposed of at the site. The incident in 1976 when Albert Skinner claimed that explosive devices were buried on site may be the source of these stories. While residents currently attribute these stories to rumor, if further studies should indicate that hazardous gases are present, the residents could become concerned about their health and their children's health.

Initiation of On-Site Work. Although the area where the disposal operations occurred is not directly visible from any nearby residences, several homes are adjacent to the access road and an elementary school is across the street from the entrance to the site. As a result, residents, teachers, and students are very aware of events at the site. Site activities could be a nuisance if site work is particularly noisy, if odors are generated, or if heavy equipment is moved into and out of the site.

The principal of the elementary school has requested specifically that any site work be done during the summer months to avoid disruption and potential hazards to children from truck traffic or releases of hazardous gases. Whether or not site work can be scheduled during the summer, it will be important for EPA to explain the extent and schedule of on-site activities to the nearby residents, and to the principal and teachers of the elementary school.

Further Delays or Complications. The unsuccessful state enforcement actions and the fact that the RI/FS was not initiated following the RAMP activities in 1983 has left the impression among some residents and local officials that nothing would be done about the site. Local officials are particularly concerned that if the site is not cleaned up under the federal Superfund, it will not get cleaned up at all. Once the RI/FS starts, the community will be particularly sensitive to any delays or complications that appear to interrupt the site work and, therefore, should be kept informed as to the reasons for the delays or changes in schedule.

B. OBJECTIVES OF THE COMMUNITY RELATIONS PROGRAM

Specific objectives of the community relations program for the Skinner Landfill site are the following:

- 1) Ensure that key local officials and staff from Ohio EPA are kept informed of all developments at the site during the remedial investigation and feasibility study. These officials include the Township Administrator, Fire Chief, and County Health Department staff; they should be notified in advance of any announcements or press releases concerning the site. If possible, officials should receive information from a single contact person at EPA.
- 2) Ensure that accurate, timely, and easily understandable information is disseminated to the community. The town is small and relatively close-knit so that information travels quickly among residents. As a result, EPA should be particularly careful to ensure that accurate information is released. EPA should place special emphasis on providing residents living closest to the site and the principal of the Union Elementary School with up-to-date information on site activities.
- 3) Ensure that issues of potential concern are directly addressed in the information provided to the community. To dispel the notion that nothing can be done about the site, EPA should make a particular effort to explain to the community what technical activities will occur during the RI/FS and what the RI/FS is intended to accomplish. In addition, EPA should explain what information is currently available on the contents of the landfill.
- 4) Provide regular opportunities for citizen input to and comment on the proposed remedial alternatives and provide a specific means for continuous communication with the local community throughout the project. If community interest increases, community relations techniques such as informal meetings with area residents are recommended so that citizens can express their concerns and ask questions in person.

- 5) Provide an opportunity for public access to the work plan, remedial investigation report and subsequent public comment on the feasibility study.

C. COMMUNITY RELATIONS TECHNIQUES

The following techniques are suggested for the Skinner Landfill community relations program:

TECHNIQUES

METHODOLOGY

- 1) Conduct meetings with local and state officials

Objective: To inform local officials of the schedule and developments during the RI/FS.

An initial meeting should occur as soon as the work plan is made final. The purpose of this meeting is to introduce EPA and EPA contractor staff responsible for the site to officials of the Ohio EPA, Butler County Health Department, and Union Township (e.g., Township Administrator and Fire Chief). This meeting is also intended to apprise these officials of the schedule of work. Other meetings and/or phone contact should be conducted to inform officials of the results of the remedial investigation and the proposed remedial alternatives. These state and local officials should be contacted prior to any press release by EPA concerning the Skinner site.

- 2) Prepare and distribute fact sheets and news releases

Objective: To ensure accurate, timely information is disseminated to the public.

An initial fact sheet and news release should be prepared to summarize the work-plan and to inform the community of the schedule and rationale for the RI/FS. Additional fact sheets and news releases should be prepared and distributed to inform the community of the results of the RI and the FS. News releases should be distributed to the press to announce public meetings and the three week public comment period. As noted above, it is important that Ohio EPA and local officials be informed of a news release before the release is circulated to the press. Fact sheets should be distributed to residents and officials prior to or during all public meetings.

- 3) Establish and maintain information repository

Objective: To ensure that accurate, understandable information is available to the public.

The information repository should be located at the Union Township Public Library and should include newspaper clippings, historical and background documents, final community relations plan, and public technical documents. In addition, the names and phone numbers of EPA officials involved with the site should be included in the repository.

- 4) Conduct public meetings

Objective: To further explain EPA's plans for the site during the RI/FS and to facilitate citizen input during the comment period on the feasibility study report.

A "kickoff" public meeting should be conducted to introduce the EPA officials and contractor staff to the community, to explain the work plan for the RI/FS, and to answer questions about the RI/FS.

A subsequent meeting should be held when the RI report is available to explain the findings of the remedial investigation.

A third public meeting should be held to answer questions and receive citizen comments on the remedial alternatives proposed for the Skinner Landfill. Ohio EPA and the Butler County Health Department should participate in scheduling and conducting the meeting.

Depending on the anticipated size of the meeting, EPA could hold meetings in a number of locations in Union Township. For the initial "kickoff" meeting, EPA should expect a high attendance (80-150 residents). Suggested meeting locations are included in Appendix A.

- 5) Conduct small, informal meetings with residents

Objective: To clarify issues of potential concern and to provide a means for two way communication between affected residents and EPA officials.

EPA, in coordination with the Ohio EPA if possible, should hold small, informal meetings with residents to monitor concerns,

answer questions, and clarify issues of potential confusion. In particular, a special effort should be made to meet with residents living closest to the site and to meet with the principal of the Union Elementary School. Meetings should occur as needed, particularly if lags or delays in on-site activity are anticipated.

- 6) Hold public comment period on the draft feasibility study

Objective: To provide citizen input to the proposed remedial alternative for the Skinner site.

A minimum three-week public comment period must be provided for citizen input and comment on the remedial alternatives presented in the FS.

- 7) Prepare responsiveness summary

A responsiveness summary is required as part of the Record of Decision for each site. The summary records major public concerns and issues raised during the public comment period on the draft feasibility study and summaries how EPA responded to these concerns.

- 8) Revise the Community Relations Plan

Objective: To revise the community relations program for Skinner to reflect changes in community concern.

If community concern changes as a result of the selection of a remedial alternative, EPA should revise the Community Relations Plan to reflect these changes and to ensure that community needs for information are met during the remedial design and remedial action stages.

D. SCHEDULE
